## Compiler Design

Lecture 19:
Instruction Selection via Tree-pattern matching

## The Concept

Many compilers use tree-structured IRs

- Abstract syntax trees generated in the parser
- Trees or DAGs for expressions

These systems might well use trees to represent target ISA
Consider the add operators

$$
\text { add } r_{i}, r_{j} \Rightarrow r_{k}
$$

$$
\operatorname{addI} r_{i}, j \Rightarrow r_{k}
$$

What if we could match these "pattern trees" against IR tree?

## The Concept

AST for $w \leftarrow(* x)-2 * y$

## The Concept

Low-level AST for $w \leftarrow(* x)-2 * y$

ARP = Activation Record Pointer $=$ frame pointer

## The Concept

Low-level AST for w $\leftarrow(* x)-2 * y$

ARP $=$ Activation Record Pointer $=$ frame pointer

## Tree-pattern matching

Goal is to "tile" AST with operation trees

- A tiling is collection of <ast,op > pairs
$\rightarrow$ ast is a node in the low-level AST
$\rightarrow$ op is an operation tree
$\rightarrow$ <ast, op > means that op could implement the subtree at ast
- A tiling 'implements" an AST if it covers every node in the AST and the overlap between any two trees is limited to a single node
$\rightarrow$ <ast, op> $\in$ tiling means AST is also covered by a leaf in another operation tree in the tiling, unless it is the root
$\rightarrow$ Where two operation trees meet, they must be compatible (expect the value in the same location)

## Tiling the Tree

## Generating Code

Given a tiled tree

- Postorder treewalk, with node-dependent order for children
$\rightarrow$ Right child of $\leftarrow$ before its left child
$\rightarrow$ Might impose "most demanding first" rule ...
- Emit code sequence for tiles, in order
- Tie boundaries together with register names
$\rightarrow$ Tile 6 uses registers produced by tiles $1 \& 5$
$\rightarrow$ Tile 6 emits "store $r_{\text {tile } 5} \Rightarrow r_{\text {tile } 1}$ "
$\rightarrow$ Can incorporate a "real" register allocator or just use virtual registers

## So, What's Hard About This?

Finding the matches to tile the tree

- Compiler writer connects operation trees to AST subtrees
$\rightarrow$ Encode tree syntax, in linear form
$\rightarrow$ Provides a set of rewrite rules
$\rightarrow$ Associated with each is a code template

## Notation

To describe these trees, we need a concise notation

## Notation

## Rewrite rules: LL Integer AST into ILOC

|  | Rule | Cost | Template |
| :---: | :---: | :---: | :---: |
| 1 | Goal $\rightarrow$ Assign | 0 |  |
| 2 | Assign $\rightarrow$ ST $\left(\operatorname{Reg}_{1}, \mathrm{Reg}_{2}\right)$ | 1 | store $\quad r_{2} \Rightarrow r_{1}$ |
| 3 | Assign $\rightarrow$ ST(+( $\left.\left.\mathrm{Reg}_{1}, \mathrm{Reg}_{2}\right), \mathrm{Reg}_{3}\right)$ | 1 | storeAO $r_{3} \Rightarrow r_{1}, r_{2}$ |
| 4 | Assign $\rightarrow$ ST(+( $\left.\left.\mathrm{Reg}_{1}, \mathrm{NUM}_{2}\right), \mathrm{Reg}_{3}\right)$ | 1 | storeAI $r_{3} \Rightarrow r_{1}, n_{2}$ |
| 5 | Assign $\rightarrow$ ST(+(NUM $\left.\left.{ }_{1}, \mathrm{Reg}_{2}\right), \mathrm{Reg}_{3}\right)$ | 1 | storeAI $\quad r_{3} \Rightarrow r_{2}, n_{1}$ |
| 6 | $\mathrm{Reg} \rightarrow \mathrm{LAB}_{1}$ | 1 | loadI $\quad l_{1} \Rightarrow r_{\text {new }}$ |
| 7 | $\mathrm{Reg} \rightarrow \mathrm{VAL}_{1}$ | 0 |  |
| 8 | Reg $\rightarrow \mathrm{NUM}_{1}$ | 1 | loadI $\quad \mathrm{n}_{1} \Rightarrow \mathrm{r}_{\text {new }}$ |
| 9 | $\mathrm{Reg} \rightarrow \mathrm{REF}\left(\mathrm{Reg}_{1}\right)$ | 1 | load $\quad r_{1} \Rightarrow r_{\text {new }}$ |
| 10 | $\operatorname{Reg} \rightarrow \operatorname{REF}\left(+\left(\operatorname{Reg}_{1}, \mathrm{Reg}_{2}\right)\right)$ | 1 | loadAO $\mathrm{r}_{1}, \mathrm{r}_{2} \Rightarrow \mathrm{r}_{\text {new }}$ |
| 11 | $\operatorname{Reg} \rightarrow \operatorname{REF}\left(+\left(\operatorname{Reg}_{1}, \mathrm{NUM}_{2}\right)\right)$ | 1 | loadAI $\mathrm{r}_{1}, \mathrm{n}_{2} \Rightarrow \mathrm{r}_{\text {new }}$ |
| 12 | $\operatorname{Reg} \rightarrow \operatorname{REF}\left(+\left(\mathrm{NUM}_{1}, \mathrm{Reg}_{2}\right)\right)$ | 1 | loadAI $\mathrm{r}_{2}, \mathrm{n}_{1} \Rightarrow \mathrm{r}_{\text {new }}$ |

## Rewrite rules: LL Integer AST into ILOC (part II)

|  | Rule | Cost | Template |
| :---: | :---: | :---: | :---: |
| 13 | $\operatorname{Reg} \rightarrow \operatorname{REF}\left(+\left(\mathrm{Reg}_{1}, \mathrm{Lab}_{2}\right)\right)$ | 1 | loadAI $\quad r_{1}, l_{2} \Rightarrow r_{\text {new }}$ |
| 14 | $\operatorname{Reg} \rightarrow \operatorname{REF}\left(+\left(\mathrm{Lab}_{1}, \mathrm{Reg}_{2}\right)\right)$ | 1 | loadAI $\quad r_{2}, l_{1} \Rightarrow r_{\text {new }}$ |
| 15 | Reg $\rightarrow+\left(\operatorname{Reg}_{1}, \mathrm{Reg}_{2}\right)$ | 1 | addI $\quad r_{1}, r_{2} \Rightarrow r_{\text {new }}$ |
| 16 | Reg $\rightarrow+\left(\mathrm{Reg}_{1}, \mathrm{NUM}_{2}\right)$ | 1 | addI $\quad r_{1}, \mathrm{n}_{2} \Rightarrow r_{\text {new }}$ |
| 17 | Reg $\rightarrow+\left(\mathrm{NUM}_{1}, \mathrm{Reg}_{2}\right)$ | 1 | addI $\quad r_{2}, \mathrm{n}_{1} \Rightarrow \mathrm{r}_{\text {new }}$ |
| 18 | $\operatorname{Reg} \rightarrow+\left(\operatorname{Reg}_{1}, \mathrm{Lab}_{2}\right)$ | 1 | addI $\quad r_{1}, l_{2} \Rightarrow r_{\text {new }}$ |
| 19 | Reg $\rightarrow+\left(\mathrm{Lab}_{1}, \mathrm{Reg}_{2}\right)$ | 1 | addI $\quad r_{2}, l_{1} \Rightarrow r_{\text {new }}$ |
| 20 | Reg $\rightarrow$ - $\mathrm{NUM}_{1}, \mathrm{Reg}_{2}$ ) | 1 | rsubI $\mathrm{r}_{2}, \mathrm{n}_{1} \Rightarrow \mathrm{r}_{\text {new }}$ |
| $\cdots$ | ... | $\ldots$ | ... |

A real set of rules would cover more than signed integers ...

## So, What's Hard About This?

Need an algorithm to AST subtrees with the rules
Consider tile 3 in our example

## So, What's Hard About This?

Need an algorithm to AST subtrees with the rules
Consider tile 3 in our example
What rules match tile 3?

## So, What's Hard About This?

Need an algorithm to AST subtrees with the rules
Consider tile 3 in our example

What rules match tile 3?

6: $R e g \rightarrow L A B_{1}$ tiles the lower left node

## So, What's Hard About This?

Need an algorithm to AST subtrees with the rules
Consider tile 3 in our example

What rules match tile 3?

6: Reg $\rightarrow \mathrm{LAB}_{1}$ tiles the lower left node
8: Reg $\rightarrow \mathrm{NUM}_{1}$ tiles the bottom right node

## So, What's Hard About This?

Need an algorithm to AST subtrees with the rules
Consider tile 3 in our example

What rules match tile 3?

6: Reg $\rightarrow \mathrm{LAB}_{1}$ tiles the lower left node
8: Reg $\rightarrow \mathrm{NUM}_{1}$ tiles the bottom right node
15: Reg $\rightarrow+\left(\right.$ Reg $_{1}$, Reg $\left._{2}\right)$ tiles the + node

## So, What's Hard About This?

Need an algorithm to AST subtrees with the rules
Consider tile 3 in our example

> What rules match tile 3 ?
> 6: $\operatorname{Reg} \rightarrow \mathrm{LAB}_{1}$ tiles the lower left node
> 8: $\operatorname{Reg} \rightarrow \mathrm{NUM}_{1}$ tiles the bottom right node
> 15: $\operatorname{Reg} \rightarrow+\left(\operatorname{Reg}_{1}, \operatorname{Reg}_{2}\right)$ tiles the + node
> 9: $\operatorname{Reg} \rightarrow \operatorname{REF}\left(\operatorname{Reg}_{1}\right)$ tiles the REF

## So, What's Hard About This?

Need an algorithm to AST subtrees with the rules
Consider tile 3 in our example

What rules match tile 3?
6: Reg $\rightarrow \mathrm{LAB}_{1}$ tiles the lower left node
8: $\mathrm{Reg} \rightarrow \mathrm{NUM}_{1}$ tiles the bottom right node
15: Reg $\rightarrow+\left(\right.$ Reg $_{1}$, Reg $\left._{2}\right)$ tiles the + node
9: $\operatorname{Reg} \rightarrow \operatorname{REF}\left(\operatorname{Reg}_{1}\right)$ tiles the REF

We denote this match as <6,8,15,9>
Of course, it implies <8,6,15,9>
Both have a cost of 4

## Finding matches

Many Sequences Match Our Subtree

|  | Cost | Sequences |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| REF |  |  |  |  |  |  |
| $\downarrow$ |  |  |  |  |  |  |
| + | 2 | 6,11 | 8,14 |  |  |  |
|  | 3 | $6,8,10$ | $8,6,10$ | $6,16,9$ | $8,19,9$ |  |
| 4 | $6,8,15,9$ | $8,6,15,9$ |  |  |  |  |

In general, we want the low cost sequence

- Each unit of cost is an operation (1 cycle)
- We should favour short sequences

## Finding matches

## Low Cost Matches

These two are equivalent in cost
6,11 might be better, because @G may be longer than the immediate field

## Tiling the Tree

## Still need an algorithm

- Assume each rule implements one operator
- Assume operator takes 0, 1, or 2 operands

Now, ...

## Tiling the Tree

Tile(n)
Label(n) $\leftarrow \varnothing$
if $n$ has two children then
Tile (left child of n)
Tile (right child of n)
for each rule $r$ that implements $n$ if (left(r) $\in$ Label(left(n)) and (right(r) $\in$ Label(right(n)) then Label $(n) \leftarrow \operatorname{Label}(n) \cup\{r\}$
else if $n$ has one child
Tile(child of $n$ )
for each rule $r$ that implements $n$
if (left(r) $\in$ Label(child(n)) then Label $(n) \leftarrow \operatorname{Label}(n) \cup\{r\}$
else /* $n$ is a leaf*/
Label(n) $\leftarrow$ \{all rules that implement $n\}$

[^0]
## Tiling the Tree

## Tiling the Tree

```
Tile(n)
    Label(n) \leftarrow\varnothing
    if n has two children then
        Tile (left child of n)
        Tile (right child of n)
        for each rule r that implements n
            if (left(r) \inLabel(left(n)) and
                (right(r) \inLabel(right(n))
                then Label(n)\leftarrowLabel(n) \cup{r}
    else if n has one child
        Tile(child of n)
        for each rule r that implements n
            if (left(r) \inLabel(child(n))
                then Label(n)\leftarrowLabel(n) \cup {r}
    else /* n is a leaf*/
        Label(n) \leftarrow{all rules that implement n }
```

## This algorithm

- Finds all matches in rule set
- Labels node n with that set
- Can keep lowest cost match at each point for each type of nodes $\rightarrow$ Dynamic programming
- Spends its time in the two matching loops

## The Big Picture

- Tree patterns represent AST and ASM
- Can use matching algorithms to find low-cost tiling of AST
- Can turn a tiling into code using templates for matched rules
- Techniques (\& tools) exist to do this efficiently

| Hand-coded matcher like Tile | Avoids large sparse table <br> Lots of work |
| :--- | :--- |
| Encode matching as an <br> automaton | O(1) cost per node <br> Tools like BURS (bottom-up <br> rewriting system), BURG |
| Use parsing techniques | Uses known technology <br> Very ambiguous grammars |
| Linearize tree into string and use <br> string searching algorithm (Aho- <br> Corasick) | Finds all matches |

## Next Lecture

- Object Oriented Programming Support

[^0]:    Notes:

    - left and right refer to the children of the AST node or left/right-hand sides of a rule
    - implements: e.g. rule 9 implements REF
