Introduction
COMP 520: Compiler Design (4 credits)

Alexander Krolik

alexander.krolik@mail.mcgill.ca

MWF 9:30-10:30, TR 1080

http://www.cs.mcgill.ca/~cs520/2018/

What is this class?

Purpose

This course is an introduction to the full pipeline of modern compilers

- It explores its application to both general-purpose and domain-specific languages; and

- Discusses virtual machines and runtime environments.

End Goal

By the end of this class you will have a working knowledge of compilers that allows you to

- Effectively use compiler tools for general-purpose and domain-specific projects; and

- Produce fully functional compilers for general-purpose languages.

Contents

- **Deterministic parsing:** Scanners, LL/LR parsers, `flex`/`bison` and `SableCC` tools

- **Semantic analysis:** abstract syntax trees, symbol tables, type checking

- **Virtual machines and run-time environments:** JVM (stack machines), virtual register machines, garbage collection

- **Code generation:** resources, templates, optimizations

- **Special topics:** GPUs, WebAssembly

Class Information

Schedule

- Lectures: 3 hours/week (MWF 9:30-10:30)

Prerequisites

- COMP 273, COMP 302, (COMP 330), ability to read and write "large" programs

- Students without COMP 330 should read the background material available at:

  `http://www.cl.cam.ac.uk/teaching/2003/RLFA/notes.pdf`

Lecturer

- Alexander Krolik, McConnell 226/234, Office Hours: Wednesdays 10:30-11:30

TA

- David Herrera (`david.herrera@mail.mcgill.ca`), McConnell 226/234, Office Hours: Thursdays 11:30-12:30

If you have class at these times, send one of us an email to arrange another meeting time.

Marking Scheme

- **Assignments**

  - 10% for individual assignments (2 x 5%)

  - 10% for the JOOS peephole optimizer (group)

- **GoLite Project**

  - 35% for content submitted at milestones (group)

  - 10% for the final compiler and report (group)

  - Group members may be given different grades if the contributions are not reasonably equal

- **Midterm:** 10% midterm (after reading week)

- **Final exam:** 25% final exam (during exam period)

- *Assignments and project milestones are due at midnight of the due date. A penalty of 10% per day late is given. Assignments will not be accepted after solutions have been circulated.*

Academic Integrity

- McGill University values academic integrity. Therefore all students must understand the meaning and consequences of cheating, plagiarism and other academic offences under the Code of Student Conduct and Disciplinary Procedures. `http://www.mcgill.ca/srr/honest/`

- In terms of this course, your responsibility is to ensure that all work is correctly attributed. Code without attribution must be entirely your own work.

- If you use some third-party code you must have permission to use it and you must clearly indicate the source.

Other Required McGill Statements

- In accord with McGill University's Charter of Students' Rights, students in this course have the right to submit in English or in French any written work that is to be graded.

Course Material

Textbook and online readings

- Recommended Textbook, *Crafting a Compiler* by Fischer, Cytron and LeBlanc, available in hardcopy at the McGill Bookstore. You can find a support web site with additional tutorial and reference information at `http://www.cs.wustl.edu/~cytron/cacweb/`.

  You can probably find a cheaper ebook version, for example on `www.amazon.ca` or `www.vitalsource.com`. Make sure that you get the version of the book with the three authors listed above. There should also be a copy on reserve in the library, and you may find other sources for the book.

- Alternate Textbook, *Modern compiler implementation in Java (2nd edition)* by Appel and Palsberg. Free online version available via McGill Library (access via a McGill IP or VPN), `http://mcgill.worldcat.org/title/modern-compiler-implementation-in-java/oclc/56796736`.

- Optional but recommended background readings; and

- Required for additional exercises.

Course Material

Slides

- Detailed (and hopefully complete) explanation of the course contents; and

- Available via the web site, either just before or after the lecture.

Course website

- `http://www.cs.mcgill.ca/~cs520/2018/`

- Contains links to examples, documentation and readings; and

- Updated frequently with slides, due dates, and assignment specifications.

Facebook group

- Facebook group for discussions at `https://www.facebook.com/groups/1588690564524014/`

Course Material

GitHub organization

- `https://github.com/comp520`

- Contains examples for scanning and parsing, and assignment starter code.

JOOS language and compiler

- <u>J</u>ava's <u>O</u>bject-<u>O</u>riented <u>S</u>ubset

- Is compiled to Java bytecode;

- Illustrates a fully fledged general purpose language;

- Is used to teach by example and will be useful for your assignments and project; and

- Has source code available on GitHub;

GoLite Project

Go Language

- `https://golang.org`

- Example of a modern language, "Go is an open source programming language that makes it easy to build simple, reliable and efficent software."

- Designed by Robert Griesemer, Rob Pike and Ken Thompson at Google

GoLite Project

- Produce a complete compiler for a significant subset of the Go programming language

- Use any compiler toolkit (C and Java tools shown in class)

- Produce any kind of output code, high-level code [C, JavaScript, Python, ...], or low-level code [assembly, LLVM, Java bytecode, Android code, ...]. We will learn Java bytecode in class.
GitHub and Groups

- The GoLite project and Peephole Optimizer are done in groups of 2 or 3

  - *Undergraduates are **strongly** recommended to work in groups of 3*

  - Picking a good group is important. If your group dynamics fail, you can either work things out, or work alone for the rest of the project

- We will use the `git` versioning system for the GoLite project

- Get started soon:

  - Setup a GitHub account and read documentation on the website as necessary

  - Start looking for your teammates! You will have to declare your group by the add/drop deadline

New Programming Languages per Year
General Purpose Languages

- Allow for arbitrarily useful programs to be written;

- Are Turing-complete in the theoretical sense; and

- Are the focus of most programming language courses.

Prominent examples

- C

- C++

- Java

- JavaScript

- Rust

- . . .

General purpose languages require full-scale compiler technology to run efficiently.

Popular Programming Languages

http://www.tiobe.com/tiobe-index/

Domain-Specific Languages

- Extend software design;

- Permit representation, optimization, and analysis in ways that low-level languages and libraries do not; and

- They may even be visual! (e.g. boxes & arrows)

Prominent examples

- LaTeX

- `yacc` and `lex`

- Makefiles

- HTML

- SVG

- ...

Domain-specific languages also require full-scale compiler technology.

What is a compiler?

When talking about compilers you might think of...

- GCC

- clang/LLVM

- javac

- rustc

- . . .

A modern compiler is much more general

- Take source code written in programming language **S**

- Produce equivalent code in target language **T**

- May perform optimizations (performance, space, size) [COMP 621]

The target language **T** can be another high-level language or machine code.

Phases of a Modern Compiler

Modern compilers are modular, consisting of multiple *phases* which form the compilation pipeline.

Each individual phase

- Is a modular software component;
- Uses input from the previous phase and outputs data for the next phase;
- Transforms between internal representations as needed;
- Has its own standard technology; and
- Is increasingly supported by automated tools.
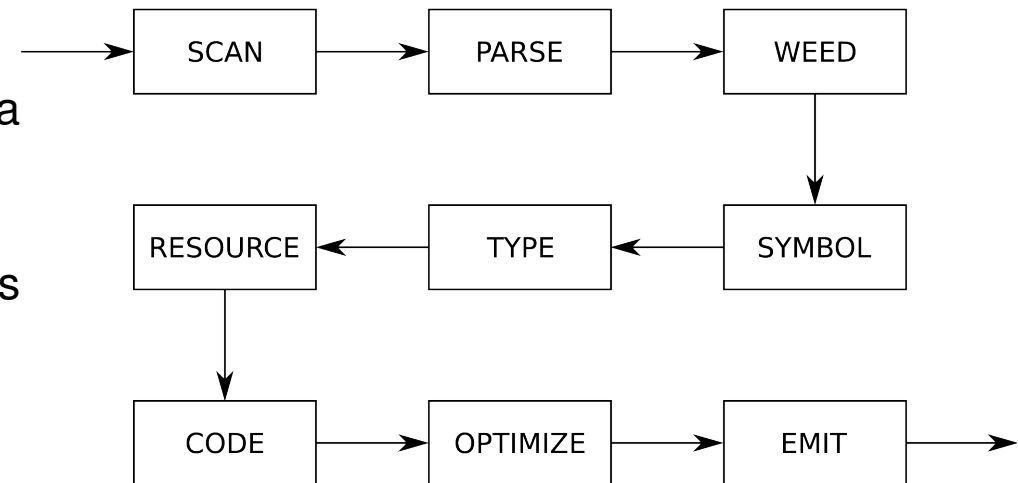

Advanced backends may contain an additional 5–10 phases, including multiple levels of optimization.

```
┌──────┐    ┌───────┐    ┌───────┐
│ SCAN │ ─► │ PARSE │ ─► │ WEED  │
└──────┘    └───────┘    └───────┘
                             │
                             ▼
┌──────────┐  ┌──────┐   ┌────────┐
│ RESOURCE │◄─│ TYPE │◄─ │ SYMBOL │
└──────────┘  └──────┘   └────────┘
     │
     ▼
┌──────┐    ┌──────────┐    ┌──────┐
│ CODE │ ─► │ OPTIMIZE │ ─► │ EMIT │ ─►
└──────┘    └──────────┘    └──────┘
```

# Phases as illustrated in the textbook, "Crafting a Compiler":

Figure 1.4: A syntax-directed compiler. AST denotes the Abstract
Syntax Tree.

History: FORTRAN

The compiler for the FORTRAN language

- Implemented in 1954–1957;

- The world's first complete compiler;

- Motivated by the economics of programming;

- Had to overcome deep skepticism;

- Paid little attention to language design;

- Focused on efficiency of the generated code;

- Pioneered many concepts and techniques; and

- Revolutionized computer programming.

Example FORTRAN Program

```
C AREA OF A TRIANGLE WITH A STANDARD SQUARE ROOT FUNCTION
C INPUT - CARD READER UNIT 5, INTEGER INPUT
C OUTPUT - LINE PRINTER UNIT 6, REAL OUTPUT
C INPUT ERROR DISPLAY ERROR OUTPUT CODE 1 IN JOB CONTROL LISTING
      READ INPUT TAPE 5, 501, IA, IB, IC
  501 FORMAT (3I5)
C IA, IB, AND IC MAY NOT BE NEGATIVE
C FURTHERMORE, THE SUM OF TWO SIDES OF A TRIANGLE
C IS GREATER THAN THE THIRD SIDE, SO WE CHECK FOR THAT, TOO
      IF (IA) 777, 777, 701
  701 IF (IB) 777, 777, 702
  702 IF (IC) 777, 777, 703
  703 IF (IA+IB-IC) 777,777,704
  704 IF (IA+IC-IB) 777,777,705
  705 IF (IB+IC-IA) 777,777,799
  777 STOP 1
C USING HERON'S FORMULA WE CALCULATE THE
C AREA OF THE TRIANGLE
  799 S = FLOATF (IA + IB + IC) / 2.0
  AREA = SQRT( S * (S - FLOATF(IA)) * (S - FLOATF(IB)) *
 +     (S - FLOATF(IC)))
      WRITE OUTPUT TAPE 6, 601, IA, IB, IC, AREA
  601 FORMAT (4H A= ,I5,5H  B= ,I5,5H  C= ,I5,8H  AREA= , F10.2,
    +        13H SQUARE UNITS)
      STOP
      END
```

Why learn about compilers?

- Understand existing languages and their implementations;

- Appreciate current limitations;

- Talk intelligently about language design;

- Implement your very own general purpose language; and

- Implement lots of useful domain-specific languages.

The top 10 reasons why we use C for compilers

10. It's tradition

 9. It's (truly) portable

 8. It's efficient

 7. It has many different uses

 6. ANSI C will never change

 5. You must (almost always) learn C at some point

 4. It teaches discipline (the hard way)

 3. Methodology is language independent

 2. We have `flex` and `bison`

 1. You can say that you have implemented a large project in C

The top 10 reasons why we use Java for compilers

10. You already know Java from previous courses

 9. Run-time errors like null-pointer exceptions are easy to locate

 8. It is relatively strongly typed, so many errors are caught at compile time

 7. You can use the large Java library (hash maps, sets, lists, . . .)

 6. Java bytecode is portable and can be executed without recompilation

 5. You don't mind slow compilers

 4. It allows you to use object-orientation

 3. Methodology is language independent

 2. We have `SableCC`, developed at McGill

 1. You can say that you have implemented a large project in Java

Compiler Research at McGill (McLAB)

Current Projects

- Array based intermediate representation for optimizing database queries (HorseIR)

- Sparse matrix operations (SpMV)

- Dynamic GPU compilation and optimization
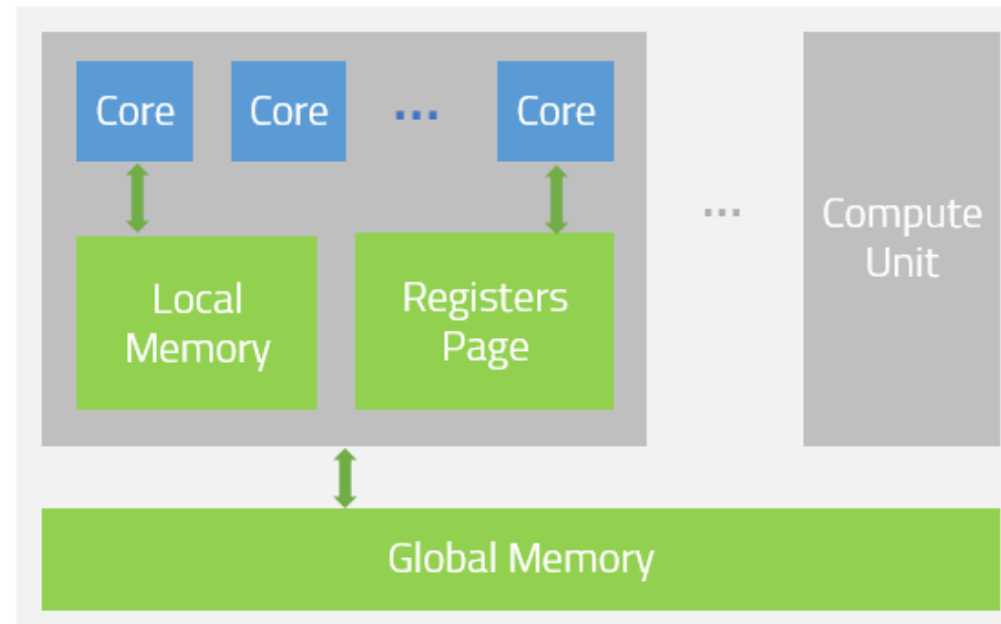

- JavaScript and WebAssembly

Past Work

- MATLAB analysis frameworks (McSAF, Tamer)

- MATLAB static compilers (Mc2For, MiX10, Matjuice)

- JIT compilation (McVM, Velociraptor)

- Programing languages and tools (AspectMATLAB)
GPU Compilation

A very different target architecture

Compute languages and APIs (CUDA, OpenCL, etc.) abstract away much of the underlying architecture.

How do we efficiently exploit the power?

Bootstrapping

What we want

- A compiler for language **L**, written in language **L**

- A compiler that compiles itself!

Bootstrapping is the process by which we produce a self-compiling compiler for a new language.

Idea!

(a) Implement a basic compiler for a workable subset of **L** in an existing programming language

(b) Implement a full compiler for **L** in the subset defined in (a)

(c) Compile (b) using (a). We now have a small (but working) compiler for **L**!
(d) Implement the full compiler for **L** in **L**

How to bootstrap a compiler (SCALA)

- Given a source language (L in the reading), say SCALA

- Given a target language (M in the reading), say Java

We need the following to execute on the JVM

source   S   J   target

J
implementation

We would rather implement SCALA in itself

source   S   J   target

S

implementation

# How to bootstrap a compiler (SCALA)

Define the following

- $S^{\downarrow}$ is a simple subset of SCALA

- J^{-} is inefficient Java code

- P is our favourite programming language, here "Pizza".

**We can easily implement a compiler for a subset of SCALA in Pizza**

$$
\begin{array}{|cc|}
\hline
S^{\downarrow} \quad _1 & J^{-} \\
\hline
\end{array}
$$

$$\boxed{P}$$

In parallel, using $S^{\downarrow}$, we implement a compiler for full SCALA

$$
\begin{array}{|cc|}
\hline
S \quad _2 & J \\
\hline
\end{array}
$$
$$\boxed{S^{\downarrow}}$$

How to bootstrap a compiler (SCALA)

Combining the two compilers (compile ② with ①), we get ②'

which is an inefficient SCALA compiler (based on generated Java code) generating efficient Java code.

A final combination (compiling ③ with ②') gives us what we want, an efficient SCALA compiler, written in SCALA, running on the Java platform ③'.

# Bootstrapping as illustrated in the textbook, "Crafting a Compiler"

Figure 1.2: Bootstrapping a compiler that generates VM instructions.
The shaded portion is a portable compiler for L that can run
on any architecture supporting the VM.
